

PrecisionTx is a one-time minimally invasive laser procedure that treats the source directly!

As the sweat glands reside underneath your skin, it is no wonder why topical treatments don't seem to get underarm sweating under control. PrecisionTx laser procedure goes right to the source, underneath the skin, to safely ablate the underarm sweat glands.

One-time, one hour minimally invasive procedure.

Procedure performed in the doctor's office.

Minimal downtime.¹

FAQs

How does the PrecisionTx procedure work?

The procedure is done under local anesthesia. Through a small incision, a cannula is inserted under the skin and thermally controlled laser energy is delivered directly to the sweat glands to ablate them.

What does the procedure feel like?

Like any other minimally invasive procedure, you may feel a light pressure during the procedure and some soreness afterwards, which will resolve rapidly. You will be able to return to your normal activities in a few days.

How long does the procedure take?

The procedure takes about one hour and is performed in your doctor's office.

"It has been a year since I had the procedure done, and the results have been long lasting. It was a very simple procedure, and it has been life-changing!"

—SM, Patient

Facts

You are not alone! Did you know that ...

- Over 2.8% of the world's population is affected by severe excessive sweating, that means more than four million people in the US.²
- In people who have excessive sweating, the sweat glands are over-reacting to stimuli such as physical activity, exercise, emotions or hormones and producing more sweat than is needed to cool the body.³
- From physical discomfort to anxiety, embarrassment and the stress of always hiding your sweat from others, excessive sweating can impact nearly all aspects of your life.²

Finally, there is a one-time procedure
for your sweat glands.
