

NEOGRAFT

The NeoGraft Difference

The FUE (Follicular Unit Extraction) hair transplant is a minimally invasive procedure, in which the graft from the back of the head (donor area) is harvested individually and placed in the thinning or balding areas on the top of the head.

The NeoGraft method of hair restoration is a minimally invasive solution, which can treat male pattern baldness and female baldness in almost half the time of any other hair restoration procedure. After years of research and development, the NeoGraft FUE method offers the least invasive technique for hair transplantation with the least complications. NeoGraft is safe, comfortable, effective, and affordable—with minimal downtime and no linear scarring.

Step One: Donor Hair Removal

The NeoGraft procedure begins with hair being removed from the donor area in the back of your head where your hair is genetically programmed to resist testosterone.

Step Two: Dissection of the Follicular Units

Each graft is extracted with the same consistency in diameter and length resulting in a dramatically increased take rate.

Step Three: Creation of the Recipient Sites

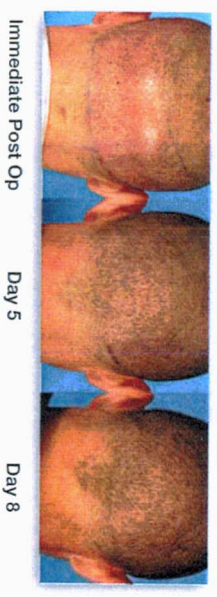

The hair transplant surgeon creates recipient sites in the proper angle, direction and orientation according to the artistic hair transplant plan he has designed specifically for you.

Step Four: Placement of the Hair Graft

The follicular units are then carefully separated by size. Grafts are transplanted into the balding and thinning areas of your scalp. Each graft is meticulously harvested as it naturally occurs and implanted individually to ensure the best results.

NeoGraft FUE vs. Traditional Strip Method

Unlike the traditional STRIP method, which requires the physician to surgically cut and remove a strip of the scalp from the back of the head and implant it into balding areas, the high-tech NeoGraft FUE device extracts follicular units and repositions them in the thinning areas. This alleviates any clumping of the transplanted hairs or scarring. NeoGraft's hand piece delivers a short, quick and very small rotational spin to loosen the follicle just enough without damaging the hair follicle.

Will a Hair Transplant Work For You?

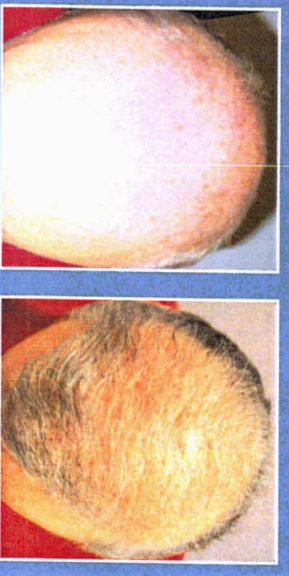

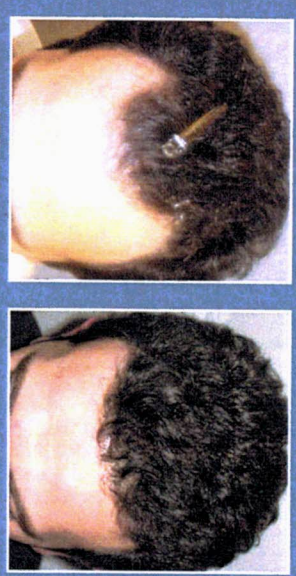

The number of grafts necessary to produce the results you desire, density of donor hair, hair color, skin color, hair texture and potential for future hair loss are some of the factors that determine candidacy for the procedure.

The ideal participant will have:

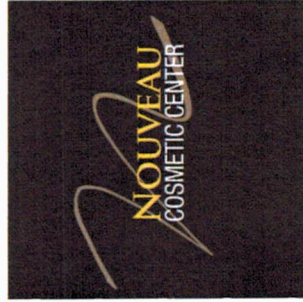

Adequate hair counts in the donor site
Realistic expectations of what the results will be

Note: One's individual hair characteristics such as color, curl and coarseness can affect the apparent density of the transplanted hair. This is discussed during the consultation.

NEOGRAFT

Natural, Permanent
RESULTS

Why Choose the **NEOGRAFT** Method of Restoration?

- Minimal discomfort
- No scalpel incision
- Least invasive procedure of its kind
- Large areas in a single session
- No sutures or linear scar
- Little to no risk of complications
- Fastest recovery time of any surgical option
- Fewer activity limitations
- More natural-looking results than traditional strip methods
